stemmed from the desire which the whites have of keeping the Indians from settling and taking possession (a fact recognized by Argentine law) of the excellent land which the local whites look upon as legitimate prey for the future.

They do not indulge in commercial enterprises; and how could they possibly do so when they have no agriculture or industries, being only wanderers and nomads? However, they do practice barter on a small scale, which is their only form of primitive, embryonic commerce. They do not have words for "buying and selling," and in order to express this idea it would seem that they had gone to some of school of economics to learn the exchange formula do ut des, for, strangely enough the Matacos, for example, instead of saying "sell me" say atquiocq niquiocq, which means "give me I give you."

One can gather from this that they have no form of money; but they have invented a word to signify our coins, which is tdócq-kynat among the Matacos and which means hide or skin of metal. Kynat is a generic word which covers all metals which do not exist or circulate in the Chaco. It would appear from this that it is a word invented prior to the appearance of paper money.

Nevertheless there is a sort of medium of exchange, though in only an incipient stage, among the inhabitants of the Chaco. It is a substance which the Indians use to paint themselves with and which is highly valued by them even in the smallest amounts. In Santa Cruz de la Sierra the plant which produces it is called urucú. This paint is obtained by boiling the fruit of the urucú for twenty-four hours, when the coloring matter floats to the top and is collected and made into small pellets of varying sizes. The dye is exuded from the skin of the fruit, which is about the size of an orange. The fruit with a blackist skin produces a black dye, the one with yellow skin gives an orange or red dye and the fruit having a white skin produces a green dye. The skin on the yellow and white varieties is about as thick as the outer covering on a walnut. Each one of the three grows on a different kind of urucú, all of which are plants which grow to be about as tall as a man, with fruit about the size of a pomegranate which split open of their own accord when they are ripe.

Although this substance is produced and made in Bolivia, it is current among all the Chaco Indians and is used by them to
